PolicyMap is a database and online mapping tool that provides data related to US policy and tools to map and analyze it.

The data is sourced from the US Census and other federal government entities, and companies such as Nielsen and Zillow, among others.

You can download data or view it with the map tab to explore geographies (such as cities, states, census tracts), the table tab to compare multiple geographies, and the report tab to view data about counties, districts, and other areas. You can also build a custom area, and upload your own address-level data.
